## ADVISIONARY INTELLIGENCE

AdVisionary is an ad-intelligence platform that transforms location data into actionable security intelligence. It enables geospatial tracking, cross-border movement analysis, geofencing, target monitoring, link analysis, path and behavior analysis, demographic profiling, and real-time alerts, helping security teams detect suspicious activity, monitor high-risk locations, identify patterns, and respond quickly to emerging threats.

## CELLEBRITE PATHFINDER

AI-powered investigative and link-analysis platform that connects digital evidence across devices, people, locations, and cases. Key features include link & location analysis, person identification, AI media analysis, topic detection, cross-case data analysis, audio transcription, multilingual translation, and automated reporting.

## NEXYTE COGNYTE

Nexyte by Cognyte is an AI-powered Decision intelligence platform that helps organizations connect and analyze data, uncover relationships and patterns, assess risks, and streamline investigations. It provides OSINT/BIZINT data, collaborative workspaces, AI-driven decision flows, automated risk analysis, identity resolution, network analysis, and unified operational views for faster, more informed decisions.

## NETWORK INTELLIGENCE

Cognyte Network Intelligence helps identify and prevent security threats by continuously capturing data from diverse communication sources, using AI-powered analytics to detect relationships, suspicious patterns, anomalies, and activities, while leveraging big-data processing and support for modern technologies such as 5G and cloud-native infrastructure for scalable and secure intelligence operations.

## BLINK BLOCKCHAIN ANALYTICS

Cognyte BLINK is an advanced blockchain analytics solution that accelerates cryptocurrency investigations by helping investigators identify suspects, trace historical and ongoing transactions, uncover hidden entities, and follow illicit money trails. It supports investigations into cybercrime, organized crime, terrorism, and money laundering, while using advanced analytics to overcome anonymity tactics, connect suspects to blockchain activities, generate new leads, and support the identification and confiscation of illicit cryptocurrency.

## EXTERNAL THREAT INTELLIGENCE

LUMINAR is an AI-powered external threat intelligence platform that provides comprehensive visibility into the cyber threat landscape through unified cyber threat intelligence, digital risk protection, and external attack surface management. It delivers actionable intelligence, GenAI-driven threat insights, brand and fraud monitoring, deep/dark web monitoring, external asset discovery, risk scoring, and vulnerability prioritization to help organizations detect, prepare for, and respond to cyber threats.

## THREAT HUNTING ANALYTICS

Cognyte HUNTICS is an advanced cyber threat-hunting platform that uses AI, big-data analytics, and automated investigations to detect unknown and sophisticated threats across organizational and backbone networks. It enables petabyte-scale data collection, anomaly detection, threat hunting, attack analysis, and MITRE ATT&CK-based analytics to identify and prevent advanced cyber attacks.

## OPERATIONAL INTELLIGENCE

Cognyte's field intelligence solutions provide security and law-enforcement teams with real-time or near-real-time actionable insights to respond quickly to changing situations. Using intuitive visualization tools, these solutions help field units understand operational information, make faster decisions, adapt to evolving conditions, and complete missions with greater speed, precision, and team safety.

## NUIX NEO INVESTIGATIONS

NuiX Neo Investigations is a scalable AI-powered investigation platform that helps investigators analyze massive datasets, connect digital evidence, uncover hidden relationships, and identify critical insights faster. It supports data from 1,000+ file types and sources, with deep link analysis, AI-powered classification, automated workflows, and real-time collaboration to streamline complex investigations and uncover actionable intelligence.

## PI-SCOUT

pi-scout is an AI-powered big-data fusion and analytics platform designed for law enforcement, forensic labs, defence, and national security. It unifies structured and unstructured evidence from CCTV, mobile, cloud, CDR/IPDR, geolocation, and multimedia sources, enabling evidence linking, timeline reconstruction, entity analysis, face/object recognition, geospatial mapping, and natural-language evidence search. It helps investigators connect fragmented data, uncover hidden patterns, reduce manual effort, and generate faster, evidence-backed intelligence while maintaining evidence integrity.

# CDR/IPDR/SDR Analytics Tools

## Contact Us

## INTELELINX CDR ANALYZER

IntelLinX is a powerful CDR/IPDR analysis platform that converts telecom data into actionable intelligence for law enforcement and national security investigations. It enables large-scale data processing, geospatial mapping, link analysis, communication pattern analysis, IMEI and multi-number tracking, case management, subject profiling, data enrichment, and one-click reporting, helping investigators uncover relationships, trace movements, identify hidden networks, and make faster, evidence-based decisions.

## ASI CDR & TOWER DUMP ANALYTICS

Windows-based Software CDR and Tower Dump analysis solution that supports multiple CDR formats, batch importing, case management, and one-click reporting. This software provides frequency, common-number/IMEI/IMSI, calling-pattern, timeline, and advanced filtering analysis, along with geo-mapping, tower/location analysis, route charts, visual reports, and automatic number searches.

## ASI CELL ID GRABBER

The software is a Windows-compatible, SIM-independent solution for collecting real-time 2G, 3G, and 4G/LTE Cell ID data from different telecom networks. It enables one-click automated operation with minimal human intervention, automatically saves collected data in Excel format, and allows the information to be quickly shared via email.

## ASI MOBILE

The ASI Mobile designed for android phones is a must have for the investigators. It helps the user to analyze CDR (Received from various Mobile Operators, quickly and efficiently, regardless of difference in File Formats, Column Formats, & Operator's Layout Formats) on their mobile phones and generate required day to day reports in less then 2 Minutes.

## C5 CDR ANALYZER

C5 CDR Analyzer is a big-data intelligence platform designed to process millions of CDR, Tower Dump, IPDR, and ILDR records and convert them into actionable investigative intelligence. It helps investigators identify locations, associates, common numbers, suspicious behavior, burner mobiles, internet activity, international connections, and hidden networks. The platform also provides data visualization, cloud data access, case repositories, database connectivity, and secure synchronization between desktop and Android applications, enabling faster and more informed investigations.

# Child Sexual Abuse Material Intelligence Tools

## S21 VISIONX

S21 VisionX is an investigator-led forensic intelligence platform for analyzing large volumes of image and video evidence, helping investigators quickly identify priority material, visual connections, and victims. Key capabilities include AI-powered CSAM categorization, victim identification, facial and visual search, object/scene search, deepfake detection, OCR, image/video enhancement, offline secure processing, team collaboration, and customizable reporting, making it suitable for high-volume forensic and law-enforcement investigations.

## S21 DISCOVERY

S21 Discovery is a secure, offline CSAM investigation platform. It provides AI-assisted CSAM categorisation, victim-identification triage, intelligence-driven search, rapid evidence prioritisation, hypothesis-led investigation, and secure air-gapped operation, helping reduce manual workload and unnecessary exposure to harmful material while keeping investigators in control.

## CELLEBRITE PREMIUM - (WITH UNLOCKS)

Cellebrite Premium is an advanced mobile forensic solution designed for law-enforcement agencies and forensic laboratories to lawfully access, unlock, and extract digital evidence from a wide range of Android and iOS devices. It enables agencies to scale mobile evidence collection through multiple UFED endpoints connected to a centralized server, improving investigative efficiency, fleet management, and case throughput. Depending on the supported device and lawful authorization, capabilities can include full file-system extraction, access to deleted data and protected application artifacts, and advanced device-access techniques. Its centralized architecture helps agencies manage multiple forensic workstations, reduce backlogs, maintain evidence workflows, and collect more digital evidence in less time.

## CELLEBRITE UFED

Cellebrite UFED is a mobile forensic extraction solution that enables investigators to lawfully collect and preserve digital evidence from a broad range of smartphones and other mobile devices. It supports multiple acquisition methods, including Full File System (FFS) and physical extraction, helping recover deeper device data, including protected and deleted content where supported. UFED solutions are available in flexible formats such as UFED 4PC, UFED Touch3, and UFED Ruggedized Laptop, allowing forensic teams to perform secure examinations in laboratories, offices, or field environments while maintaining forensic integrity.

## OXYGEN FORENSICS DETECTIVE

Oxygen Forensics is a mobile data collection solution supporting 35,000+ devices, enabling investigators to quickly acquire and analyze data from a wide range of smartphones and other mobile devices. It provides advanced extraction and decryption capabilities, helping access protected data where supported, while its high-speed collection technology is designed to accelerate forensic examinations and reduce investigation time.

## MD-RED

MD-RED is an AI-powered forensic analysis platform for recovering, decrypting, analyzing, visualizing, and reporting digital evidence from mobile devices and applications. It supports 2,600+ mobile apps, file-system and image analysis, deleted-data recovery, CDR analysis, malware scanning, GPS and timeline visualization, facial and object detection, OCR, speech-to-text, AI translation, and relationship analysis. It also supports evidence from multiple forensic tools and generates reports in Excel, PDF, HTML, XML, and SQLite formats, helping investigators turn complex digital evidence into actionable intelligence.

## XRY PHYSICAL

XRY Physical gives forensic specialists the power to go beyond the operating system and extract raw data directly from a device's internal memory. This advanced method allows you to access system files, protected data, and even deleted data—helping you bypass security and encryption barriers on locked devices.

## XRY EXPRESS

MSAB XRY Express is a Windows-based mobile forensic solution designed to reduce forensic lab backlogs by enabling frontline operators to perform mobile device extractions through customizable, guided workflows. It supports organization-specific SOPs, locked-down user workflows, automatic audit logging, centralized management, network deployment, and integration with existing Windows PCs, allowing routine extractions to be handled efficiently while forensic experts focus on more complex examinations.

## XRY PRO EXPRESS

XRY Pro Express is a locked-down mobile forensic extraction solution designed for trained frontline personnel. It brings XRY Pro's advanced device-access capabilities into a simple, controlled workflow, including proprietary access methods and Android brute-force capabilities. Key features include customizable ISO 17025-compliant workflows, controlled user access, simple Windows-based deployment, and centralized administration with audit trails, helping organizations perform advanced extractions while reducing the workload on specialist forensic teams.

## XRY KIOSK

MSAB XRY Kiosk is a secure, locked-down turnkey mobile forensic workstation designed for rapid and consistent extraction of data from mobile devices with minimal training. It provides guided touchscreen workflows, automated audit logging, immediate reporting, and customizable procedures aligned with forensic standards, helping organizations decentralize mobile forensics, reduce extraction backlogs, and allow frontline personnel to process devices efficiently.

## PARABEN E3 FORENSIC

E3 is a versatile mobile forensic solution designed to extract and analyze data from smartphones, feature phones, GPS devices, and IoT devices such as smartwatches, drones, home devices, and gaming consoles. It supports multiple acquisition methods, including rooting, jailbreaking, ADB backup, downgrading, and chip dumps, and can also import and analyze data from tools such as GrayKey, Cellebrite, Oxygen Forensics, and Passware, making it suitable for comprehensive mobile and connected-device investigations.

## SECFORE EXTRACTOR

Secfore Extractor is a plug-and-play mobile forensic acquisition tool for Android and iOS devices, designed for fast and forensically sound evidence extraction. It supports logical, file-system, targeted application, and encrypted app-data extraction, with 20+ supported brands, 100+ tested device profiles, SHA-256 hash verification, real-time extraction monitoring, detailed logs, error reporting, and system diagnostics. Its one-click workflow makes it suitable for both frontline investigators and experienced forensic examiners, while maintaining evidence integrity for court-ready investigations.

## SECFORE VISUALIZER

Secfore Visualizer is an AI-powered mobile forensic analysis and intelligence platform that transforms extracted evidence into actionable investigative insights. It provides 14+ analysis modules, including unified timelines, cross-app communication analysis, location mapping, UPI transaction tracing, contact intelligence, and person-centric profiling. Investigators can use AI-powered search, OCR, visual analytics, chat analysis, deleted-data views, relationship mapping, and interactive timelines to correlate calls, messages, media, locations, and transactions from a single interface. It also supports forensically sound analysis with cryptographic hash verification and court-ready reporting.

## SECFORE INTELLIGENCE

Secfore Intelligence Engine is an AI-powered forensic analysis platform that transforms large volumes of digital evidence into actionable intelligence. It combines AI-based image classification, face detection and grouping, object and risk-content identification, OCR, document analysis, semantic search, and reverse image search to help investigators quickly locate relevant evidence and uncover hidden connections. The engine supports millions of artifact analyses and performs processing locally on the investigator's workstation rather than in the cloud, helping maintain control over sensitive forensic data.

## MSAB RAVEN

MSAB Raven is a highly portable mobile digital forensics platform designed for front-line responders and field investigators to rapidly collect and analyze digital evidence. Built on Android, Raven provides specialized applications for extracting data from iOS and Android devices, SIM cards, flash media, and commercial drones. Its modules—MobEX, SIMEX, FlashEX, DronEX, and Odin—support targeted extraction, write-protected media acquisition, drone flight-log analysis, watchlist and hash searching, and rapid evidence review, enabling investigators to turn collected data into actionable intelligence with minimal training.

# Mobile Forensics Tools ( Hardware )

## XRY TABLET

MSAB Kiosk Tablet is a portable mobile forensic solution designed for rapid, controlled device extraction and forensic reporting in the field or laboratory. It offers customizable workflows, minimal training, secure XRY file handling, rapid extraction, automated reporting. Its ruggedized, flexible design with a touchscreen, detachable keyboard, SIM and memory-card readers makes it suitable for mobile forensic teams requiring portable and efficient evidence collection.

## MD-BOX

MD-BOX by GMDISOFT is a forensic hardware tool designed to extract data directly from mobile device motherboards through the JTAG interface. It supports various mobile CPU platforms and advanced extraction functions such as partition scanning, selective extraction, differential verification, and physical extraction, while maintaining data integrity through write protection and hash verification. Extracted data can be saved as physical disk images for further analysis with MD-NEXT.

## MD-READER

MD-READER by GMDISOFT is a forensic hardware tool designed to extract data directly from detached flash memory removed from a mobile phone or digital device motherboard. It supports eMMC and eMCP memory sockets, SD cards, selective partition extraction, and chip-off data acquisition, with write protection and hash verification to help maintain evidence integrity. Extracted data can be saved as MD image files for further analysis in MD-NEXT.

## MD-MR HARDWARE KIT

MD-MR by GMDISOFT is the package of hardware devices for detaching memory chips from mainboard of a mobile phone or a digital device. When the device is severely broken, burnt, or drowned, MD-MR is used before Chip-off forensics. MD-MR includes 5 flash memory sockets for MD-READER, heat blower, soldering station, fume extractor, microscope with optional components of mobile device dryer, rework system and mobile device safety box

# Mobile Forensics Tools ( Analyzer & All in one )

## PHYSICAL ANALYZER

Cellebrite Physical Analyzer is an advanced digital forensic analysis solution designed to examine and decode evidence from a wide range of mobile devices, applications, cloud sources, and extraction formats. Analyzer provides automated decoding and decryption, application intelligence, visual timelines, deleted-data carving, advanced SQLite analysis, Android application emulation, cloud-data review, multilingual translation, and customizable reporting, helping investigators quickly uncover and validate critical evidence from complex forensic datasets.

## XAMN PRO

XAMN Pro is a mobile forensic analysis solution designed to discover, analyze, visualize, and report digital evidence from mobile extractions, third-party forensic data, CDRs, warrant returns, and personal data requests. It provides advanced search and filtering, conversation and connection views, geolocation maps, tagging, timeline analysis, customizable report building, and flexible export options, helping investigators quickly identify relevant evidence and create clear, professional forensic reports.

## OXYGEN FORENSICS DETECTIVE - ALL IN ONE

Oxygen Forensic Detective – Mobile Analysis provides investigators with powerful tools to decode, search, correlate, and visualize data extracted from mobile devices. It supports analysis of calls, messages, applications, contacts, media, browser activity, locations, and device artifacts, with features such as advanced search and filtering, timelines, activity analysis, geolocation mapping, social-graph/link analysis, facial and image categorization, OCR, and key-evidence tagging. Investigators can also compare device call/message data with CDRs, identify relationships and activity patterns across multiple sources, and generate customized forensic reports.

## BELKASOFT X - ALL IN ONE

Belkasoft X provides comprehensive mobile forensic capabilities for iOS and Android devices, including passcode brute-force and multiple acquisition methods such as backups, agent-based extraction, lockdown files, checkm8, and application downgrade. It can analyze calls, messages, emails, messaging and social-media applications, cryptocurrency data, browsers, and other mobile artifacts, while also supporting forensic images from UFED, GrayKey, chip-off, JTAG, TWRP, and mobile backups for consolidated investigation and analysis.

# Mobile Forensics Tools ( Vulnerability Test )

## CORELLIUM FALCON

Corellium Falcon - Cellebrite is a virtual mobile security research platform that provides government and security teams with on-demand iOS and Android virtual devices for vulnerability research, exploit analysis, malware analysis, and app security testing. Key capabilities include real-time OS and kernel introspection, filesystem and network monitoring, debugging, jailbreak/root access, Frida integration, snapshot and cloning, malware sandboxing, and automated testing, enabling researchers to investigate mobile threats and validate vulnerabilities without relying entirely on physical devices.

## CORELLIUM VIPER

Corellium Viper - Cellebrite is a virtual mobile app security testing platform that provides scalable iOS and Android virtual devices for application pentesting, vulnerability assessment, and DevSecOps testing. It supports static and dynamic testing, jailbreak/root access, Frida integration, process tracing, filesystem and network analysis, automated MATRIX testing and reporting, snapshot/clone capabilities, and continuous security testing. Viper helps security teams reduce reliance on physical devices while enabling faster, scalable, and controlled mobile application security assessments.

## EXTERRO FTK

Exterro FTK is an enterprise-grade digital forensic investigation platform designed to rapidly process, search, and analyze large volumes of digital evidence. It provides high-speed evidence processing, deep artifact analysis, advanced search and filtering, timeline visualization, AI-assisted review, and defensible forensic workflows, helping investigators uncover critical evidence faster, reduce case backlogs, reconstruct events, and produce reliable findings for legal, corporate, and security investigations.

## EXTERRO FTK CENTRAL

Exterro FTK Central is a centralized enterprise investigation platform that combines live endpoint forensics, evidence collection and processing, case management, collaboration, workflow automation, and AI-assisted investigations. With ARMOUR for FTK, investigators can describe objectives in plain language and coordinate authorized forensic actions across endpoints, correlate evidence from processes, memory, logs, files, browsers, communications, and timelines, and receive explainable, investigator-validated findings. It helps teams establish investigation scope faster, reduce manual work, and manage cybersecurity, insider-risk, legal, and regulatory investigations from one platform.

## ADF DEI

Digital Evidence Investigator (DEI) is a rapid computer forensics and triage solution for law enforcement and forensic teams. It enables RAM capture, physical/logical scanning, live evidence preview, artifact analysis, relationship mapping, keyword/hash searches, and AI-assisted image classification. Investigators can quickly tag, review, and export evidence in HTML, CSV, PDF, or JSON formats.

## BELKASOFT X (COMPUTER ARTIFACT)

Belkasoft X Forensic is a comprehensive digital forensic platform for examining computers, hard drives, disk images, virtual machines, RAM, and cloud data. It supports analysis of messengers, browsers, emails, documents, multimedia, system files, payment applications, and other artifacts, with advanced capabilities such as connection graphs, timelines, data carving, file-system exploration, Registry, SQLite/Plist, Hex viewers, encryption support, and automated workflows. It helps forensic laboratories recover, correlate, and analyze digital evidence efficiently across complex investigations.

## ENCASE (OPENTEXT FORENSICS)

OpenText Forensic (EnCase) is an industry-leading digital forensic investigation platform designed to collect, triage, analyze, and report digital evidence from computers, mobile devices, cloud sources, and other digital environments. It combines artifact-first workflows, AI-powered image classification, encrypted file-system acquisition, workflow automation, volume shadow copy analysis, advanced evidence search, visualization, and customizable court-ready reporting. With support for 36,000+ device profiles, cloud apps, and file systems, it helps investigators uncover critical evidence faster while maintaining forensic integrity and defensible workflows.

## MAGNET AXIOM

Magnet AXIOM is a comprehensive digital forensic investigation platform that helps investigators recover, analyze, correlate, and report digital evidence from computers, mobile devices, cloud services, and other digital sources. It provides advanced artifact analysis, timeline reconstruction, link and communication analysis, media examination, powerful searching and filtering, and customizable reporting, enabling forensic teams to connect evidence across multiple sources and uncover actionable insights efficiently.

## PARABEN E3 COMPUTER FORENSIC

Paraben E3 provides a comprehensive computer forensics solution for collecting, processing, and analyzing evidence from Windows, macOS, and Linux systems, including physical/virtual drives, disk images, email, browsers, chats, social media, cloud data, registry, databases, archives, and memory dumps. It supports numerous forensic image and third-party tool formats, along with mobile and cloud evidence integration, artifact analysis, data recovery, metadata extraction, OCR, indexing, and reporting, enabling investigators to efficiently correlate diverse digital evidence within a single case workflow.

## ADF PRO

Advance Digital Forensic PRO is an all-in-one digital forensic triage solution for smartphones, computers, and storage devices, designed for rapid on-site investigations. It supports multi-device acquisition, RAM capture, live evidence preview, artifact analysis, AI-assisted image classification, relationship mapping, keyword/hash searches, and real-time profiling. Investigators can quickly identify relevant evidence, tag and review findings, and generate HTML, CSV, PDF, and JSON reports.

# All In One Forensics Tools (Windows, Linux, Mac)

## Contact Us

## NBFTOOLS NETRE

NBFTools NETRE is a digital forensic triage and acquisition software solution for Windows, Linux, and macOS systems. It supports live and boot-based imaging, E01/DD/virtual disk formats, Apple Silicon and Intel Mac acquisition, FileVault-encrypted systems, selective data collection, volatile data acquisition, and user/file-specific targeting. NETRE also helps preserve hashes and timestamps and supports iOS data acquisition across major operating systems, making it suitable for fast and targeted forensic evidence collection.

## NBFTOOLS TRIOS

NBFTools TRIOS is a digital forensic analysis software for Windows, macOS, and Linux that examines forensic images from computers, servers, mobile devices, USB drives, and cloud backups. It supports major file systems and encrypted images, with automated analysis of browser activity, Registry, macOS artifacts, emails, messages, images, metadata, faces, OCR, and timelines. TRIOS also provides comprehensive forensic reporting in HTML, PDF, XML, CSV, and KML formats, helping investigators analyze large datasets efficiently.

## OXYGEN FORENSICS DETECTIVE - COMPUTER ARTIFACT COLLECTION

Oxygen Forensics provides comprehensive computer artifact collection for Windows, macOS, and Linux, enabling investigators to securely acquire evidence from active and complex systems. It helps preserve volatile data, collect application-specific, deleted, unallocated, and encrypted artifacts, and efficiently process large volumes of computer data through automated collection workflows—allowing investigators to uncover critical evidence faster.

## CELLEBRITE INSPECTOR

Cellebrite Inspector is a computer forensic analysis solution for Windows and Mac that enables investigators to quickly examine computer extractions and uncover internet activity, downloads, searches, locations, messages, USB connections, system artifacts, and timelines. It supports Windows, macOS, iOS, and Android data, AI-assisted media categorization, encrypted-device analysis, advanced filtering, and customized court-ready reporting, helping investigators efficiently analyze large datasets and identify critical evidence.

## CELLEBRITE DIGITAL COLLECTOR

Cellebrite Digital Collector is a forensic imaging and triage solution for Windows and macOS computers, enabling live data acquisition, targeted collection, and forensic imaging. It supports on-scene triage, selective file and folder extraction, RAM capture, metadata and hash preservation, and acquisition from encrypted systems, including Apple T2 and FileVault environments.

# Damage Drive/ Mobile Recovery Forensics Tools

## ATOLA TASKFORCE 2

Atola TaskForce 2 is a high-performance forensic imaging hardware solution designed for large-scale evidence acquisition. It can image 25+ drives simultaneously at up to 25 TB/hour, with support for SATA, SAS, NVMe, USB, IDE, RAID arrays, and damaged drives. It provides hardware write protection, automated RAID reassembly, logical and physical imaging, hashing, workflow automation, and remote/network-based acquisition.

## ATOLA TASKFORCE

Atola TaskForce is a high-performance forensic imager designed for fast acquisition from both healthy and damaged storage media. It supports 12+ simultaneous imaging sessions, up to 15 TB/hour, 18 ports for SAS, SATA, USB and IDE, plus expansion for NVMe, M.2 and Apple PCIe drives. Key capabilities include hardware write blocking, automated RAID detection and reassembly, damaged-drive imaging, physical and logical imaging, hashing, case management, and Web API automation. It can be operated standalone or remotely through a Chrome-based interface, making it suitable for forensic labs and field investigations.

## ATOLA INSIGHT FORENSIC

Atola Insight Forensic is a portable forensic imaging and data recovery solution designed for healthy and damaged storage media. It supports 3 simultaneous imaging sessions, hardware write blocking, SATA/IDE/USB drives with expansion for SAS, NVMe and PCIe SSDs, and imaging to E01, AFF4, or RAW formats. Advanced capabilities include automated drive diagnostics, damaged-drive recovery, multipass imaging, bad-sector recovery, ATA-locked drive access, low-level artifact searching, forensic file recovery, hashing, and detailed case reporting, making it suitable for both laboratory and field investigations.

## PC-3000 PORTABLE PRO

PC-3000 Portable PRO by ACELAB is a professional hardware-based data recovery and storage diagnostics solution for recovering data from damaged or logically corrupted storage devices. It supports SATA/PATA/USB HDDs, SAS drives, SATA and PCIe NVMe SSDs, Apple Mac SSDs, U.2/U.3, CFexpress, SD/microSD cards, RAID, and logically damaged NAND Flash. With four diagnostic ports and support for up to three PCIe/NVMe devices simultaneously, it provides drive diagnostics, SMART monitoring, sector-level analysis, imaging, hashing, RAID analysis, password removal on supported locked drives, and advanced recovery functions. Its Standalone, Enhanced Easy, and Full-Featured modes make it suitable for both on-site recovery and professional forensic/data-recovery laboratories.

## PC-3000 EXPRESS SYSTEM - HDD

PC-3000 Express Professional System by ACELAB is a high-performance hardware-software data recovery solution designed for fast recovery from damaged SATA and PATA HDDs. It supports multiple manufacturers, capacities, and major file systems including FAT, exFAT, NTFS, HFS+, APFS, EXT, XFS, ZFS, and virtual disk images. With four simultaneous recovery tasks, it enables rapid turnaround for urgent cases and is suitable for both small data-recovery laboratories and high-volume professional recovery centers. The system combines PC-3000 Express hardware/software with Data Extractor Express for efficient recovery workflows.

## PC-3000 UDMA SYSTEM - HDD

PC-3000 UDMA Professional System is a professional hardware-software data recovery solution for diagnosing, repairing, and recovering data from damaged SATA and ATA (IDE) HDDs, supporting 3.5" desktop and 2.5" laptop/external drives. Designed as a reliable everyday recovery platform, it offers an effective balance of performance and cost, making it suitable for small and medium-sized recovery labs as well as routine workloads in larger laboratories. The system includes PC-3000 UDMA hardware/software and Data Extractor UDMA.

## PC-3000 SAS RAID

PC-3000 SAS RAID Professional System is a professional hardware-software solution for recovering data from damaged SAS and SCSI-based RAID storage systems. It supports a wide range of RAID configurations, including Stripe, Mirror, JBOD, RAID 4/5/6, combined RAID levels, and custom configurations, along with Windows Storage Spaces, ZFS RAID-Z, Btrfs RAID, and Apple Fusion Drive. The system combines PC-3000 SAS System hardware with Data Extractor SAS RAID Edition for advanced RAID data recovery.

## PC-3000 FLASH

PC-3000 Flash is a professional hardware-software data recovery solution for NAND-based storage devices where standard interfaces are inaccessible. It supports USB Flash drives, SD/microSD, CompactFlash, Memory Stick, xD, MMC, monolithic flash devices, voice recorders, and selected older iPhones. Using direct NAND chip access and specialized Flash Readers, it can recover data even when the device controller is damaged. Key capabilities include automatic chip identification, complex NAND analysis, ECC/XOR processing, chip reconstruction, continuously updated memory libraries, and automated recovery workflows, making it suitable for advanced flash-media data recovery.

## PC-3000 SSD

PC-3000 SSD is a specialized hardware-software solution for diagnosing, repairing, and recovering data from SSDs using SATA, PATA, mSATA, M.2, PCIe NVMe/AHCI, PCIe x16, Apple Mac SSD, U.2/U.3, and CFexpress interfaces. It provides advanced capabilities such as SSD diagnostics, service-information recovery, ROM and microcode operations, translator emulation, password reset on supported drives, direct memory-chip access, defect management, and Data Extractor integration.

## ELCOMSOFT EFS DATA RECOVERY

Elcomsoft EFS Data Recovery (AEFSDR) is a specialized forensic recovery solution designed to decrypt files protected by Microsoft Encrypting File System (EFS) on Windows systems. It can recover inaccessible EFS-encrypted data from deleted user accounts, transferred domains, damaged or unbootable systems, reformatted partitions, and disks moved to different computers. The Professional edition can perform low-level, sector-by-sector scanning to locate deleted encryption keys, making it particularly useful for digital forensic investigators, data recovery specialists, and law enforcement agencies handling encrypted Windows evidence.

# Disk Duplicator Forensics Tools & Write Blocker

## Contact Us

## OPENTEXT FORENSIC IMAGER TX2

OpenText Forensic TX2 Imager is a high-performance standalone forensic imaging hardware solution designed for fast and defensible acquisition of digital evidence. It supports PCIe, SATA, USB, and—through adapters—SAS, IDE, and FireWire media, along with Apple and Android mobile backup acquisition. Key features include up to 5× faster acquisition and verification, concurrent imaging and verification, parallel/tree hashing, hardware write-protection workflows, PCIe hot-swap, MFA security, gallery-based triage, and multiple simultaneous imaging jobs. It is suitable for both forensic laboratories and field evidence acquisition.

## FORENSIC TD4 DUPLICATOR

OpenText Forensic TD4 Duplicator is a portable forensic hardware solution designed for rapid field triage, disk acquisition, duplication, and media management. It supports SATA, SAS, PCIe, and USB drives, with PCIe hot-swapping, targeted logical imaging, disk-to-disk or disk-to-file duplication, and up to five destination copies per job. It also provides MD5, SHA-1, and SHA-256 hashing, file-system awareness, detailed logs, touchscreen workflows, and secure media wiping and formatting, helping investigators acquire and manage digital evidence efficiently while maintaining evidence integrity.

## FORENSIC BRIDGES WRITE BLOCKER

OpenText Forensic Bridges are professional hardware write blockers designed to prevent write access to suspect storage media during forensic acquisition, providing read-only access and helping preserve evidence integrity and chain of custody. They support a broad range of interfaces, including SATA, SAS, PCIe, USB 3.0, IDE, and FireWire, with transfer speeds of up to 5 GB/s via USB 3.0 host connection. Available in portable and drive-bay formats, they are suitable for both field operations and forensic laboratories, providing secure, reliable, and forensically sound evidence acquisition.

# Digital Forensics and Incident Response Tools

## RAPIDFIR

RapiDFIR by iinefu is an AI-driven Digital Forensics and Incident Response (DFIR) platform designed for SOC's, MSSP's, DFIR teams, and law enforcement to rapidly investigate cyber incidents. It enables remote evidence collection from distributed endpoints, automated forensic artifact analysis, real-time dashboards, centralized case management, AI-assisted investigations, one-click forensic reporting, and EDR/SOAR integration. With support for 100+ forensic artifacts, RapiDFIR helps organizations detect, prioritize, and respond to cyber threats faster while reducing manual investigation time and minimizing the need for on-site forensic teams.

## ENDPOINT FORENSICS & RESPONSE

OpenText Endpoint Forensics & Response is an enterprise-grade DFIR platform that combines deep endpoint forensics with near real-time incident response. It enables security teams to collect and analyze live endpoint evidence, investigate threats, isolate compromised systems, terminate malicious processes, remediate files, and hunt for indicators of compromise (IoCs) from a single platform. It supports artifact-driven triage, YARA-based IoC scanning, registry analysis, memory investigation, automated zero-trust collections, and large-scale deployments of over 1 million endpoints, making it suitable for ransomware response, insider-threat investigations, APT hunting, breach response, and compliance investigations.

## ENDPOINT INVESTIGATOR

OpenText Endpoint Investigator is an enterprise-grade digital forensics and internal investigation platform designed for discreet, remote, and forensically sound evidence collection across laptops, desktops, servers, and mobile devices. It enables investigators to remotely search, collect, and analyze endpoint data both on and off VPN, with automated agent deployment and support for large-scale environments exceeding 1 million endpoints. It is particularly suited for cybercrime, data breach, fraud, insider-threat, HR, compliance, IP theft, and regulatory investigations, while minimizing disruption to employees.

## OXYGEN REVIEW CENTER

Oxygen Review Center is a secure, browser-based collaborative evidence review platform designed for enterprises, law firms, service providers, law enforcement, and government agencies. It enables multiple users to review, search, tag, bookmark, annotate, and report on forensic data simultaneously from any authorized device. With role-based access, advanced filtering, real-time collaboration, customizable reporting, and on-premises or cloud deployment, Review Center helps technical investigators and non-technical stakeholders work together, reduce investigation backlogs, and accelerate case resolution.

# MAGNET AXIOM CYBER™

## MAGNET AXIOM CYBER

Magnet Axiom Cyber is an enterprise digital forensics and incident investigation platform designed to investigate evidence across remote Windows, macOS, and Linux endpoints, cloud environments, and mobile devices. It supports targeted and remote evidence collection—even from off-network systems—along with analysis of physical drives and memory. Investigators can use artifact-first analysis, data visualization, root-cause investigation, YARA rules, MITRE ATT&CK integration, Email Explorer, Mobile View, and IOC Insights to identify and correlate critical evidence. It can be deployed on-premises, in the cloud, or in a hybrid environment, with guided workflows and automated targeted collections to accelerate complex corporate investigations.

# MAGNET NEXUS™

## MAGNET NEXUS

Magnet Nexus is a SaaS-based, large-scale remote endpoint investigation platform designed to help DFIR teams collect and analyze evidence from Windows, Linux, and macOS endpoints at scale. Its lightweight hybrid agent enables targeted or comprehensive collection, real-time artifact insights, multi-endpoint processing, centralized endpoint management, and team collaboration—including when endpoints are off-network. Nexus can work with cloud-based workflows or Magnet Axiom Cyber for on-premises investigations, giving organizations flexibility over data storage and processing.

## E3 REMOTE IMAGING

Paraben E3 Remote Imaging is a forensic-grade remote acquisition solution that enables investigators to collect evidence from computers, cloud environments, network locations, and selected application data without being physically present at the device. It supports logical imaging, targeted artifact collection, remote and cloud acquisition, and application-specific data collection, with support for platforms such as Discord, Dropbox, Facebook, Instagram, Skype, Slack, Google Drive, and Microsoft Teams. The E3 Remote Imager supports x86/x64 systems, VPN environments, TLS 1.2 encrypted transfers, and remote acquisition of changing data during active incidents, with collected evidence subsequently processed and analyzed within the E3 platform.

## FTK CONNECT

FTK Connect can also integrate with SIEM/SOAR, case-management, eDiscovery, and other third-party platforms to automatically trigger remote endpoint or memory collection when an incident is detected. It supports scheduled and event-driven workflows, watch-folder processing, automated notifications, and API-based integrations, helping reduce manual work and investigation backlogs. Exterro FTK Connect is a forensic workflow automation and orchestration platform designed to streamline digital investigations for enterprises and law enforcement. It uses a simple drag-and-drop workflow builder to automate tasks such as case creation, evidence processing, keyword searching, tagging, reporting, and exporting.

## BELKASOFT INCIDENT INVESTIGATIONS

Belkasoft Incident Investigations is a Windows-focused cyber incident investigation solution designed to help organizations detect, investigate, and understand hacking attempts and endpoint attacks. It analyzes registry data, event logs, system files, remote connections, browser activity, downloads, persistence mechanisms, and malware-execution artifacts to identify attack vectors, suspicious activity, and attacker behavior. Investigators can search, bookmark, correlate evidence, and generate detailed incident reports, supporting faster and more structured incident response.

## BELKASOFT REMOTE ACQUISITION

Belkasoft Remote Acquisition (Belkasoft R) is a remote evidence collection solution designed for incident response and digital investigations across geographically distributed endpoints. It enables investigators to remotely acquire hard drives, removable media, RAM, connected iOS/Android devices, or selected artifacts from multiple endpoints. Agents can be deployed through GPO, WMI, USB, or network shares, with support for local networks, VPNs, and subnets. Investigators can perform selective acquisition, hashing, compression, scheduling, and encrypted data transfer, helping collect critical evidence efficiently while managing network bandwidth. Acquired data can then be analyzed using Belkasoft X, including its Timeline, Connection Graph, Cross-Case Search, and Incident Investigation capabilities.

## OXYGEN REMOTE EXPLORER

Oxygen Remote Explorer is an enterprise-focused remote digital forensics and investigation platform designed for incident response, corporate investigations, and eDiscovery. It enables remote and targeted evidence collection from Windows, macOS, and Linux endpoints, as well as Android and iOS devices, cloud services, and IoT devices. Investigators can collect registry and log data, emails, web artifacts, files, documents, RAM, and mobile/cloud data, with scheduled or simultaneous acquisitions. Built-in Timeline, Social Graph, OCR, image categorization, keyword/RegEx search, and reporting capabilities help investigators quickly identify and correlate relevant evidence while minimizing disruption to end users.

# DVR Forensics & Facial Recognition Tools

## Contact Us

+91 97110 15337 | +91 89823 07608

hello@forfrasolutions.com |

www.forfrasolutions.com

## MAGNET WITNESS

Magnet Witness is a specialized video forensics and evidence investigation platform that enables investigators to acquire, review, analyze, and export video evidence from sources such as CCTV/DVR systems, body cameras, mobile devices, drones, dashcams, and cloud-based surveillance systems. It can directly acquire video from DVR hard drives, including deleted or partially overwritten footage, and supports review of native and proprietary video formats. Investigators can correlate footage from multiple sources, reconstruct timelines, and produce court-ready, auditable reports and concatenated videos for clear presentation of findings.

## MD-VIDEO AI

MD-VIDEO AI is an AI-powered video forensic and multimedia recovery solution designed to recover, enhance, analyze, and authenticate video and image evidence. It supports video/audio recovery, metadata and channel/time information, object and anomaly detection, vehicle and license-plate analysis, image enhancement, number-plate restoration, face restoration and deepfake detection, and person identification. The solution helps investigators recover critical multimedia evidence and extract actionable intelligence from CCTV, dashcams, drones, body cameras, IoT cameras, and other video sources.

## INNEFU AI VISION

AI Vision is an AI/ML-powered image and video analytics platform for real-time surveillance, reconnaissance, and threat detection. It analyzes live CCTV feeds and recorded video to provide facial recognition, crowd analysis, object and incident detection, suspicious-behavior detection, and real-time/offline alerts. The platform is designed to help law enforcement, defence, BFSI, and enterprises improve situational awareness, threat identification, public safety, and automated response.

## PI-SENSE

pi-sense by Pi Lab is an AI-powered video forensics and visual evidence analysis platform designed for forensic laboratories, law enforcement, and intelligence agencies. It analyzes CCTV, bodycam, dashcam, smartphone, and social-media video to identify faces, objects, activities, and license plates, while also providing natural-language video search, intelligent event summarization, timestamp and metadata analysis, and video-tampering detection. It can track people and objects across footage, highlight key events, and generate forensic-grade, courtroom-ready reports, with deployment available on-premises or in the cloud.

## DVRCONV

Amped DVRConv is a specialized forensic CCTV/DVR video conversion software that converts proprietary and often unplayable video files from CCTV/DVR systems, dashcams, body-worn cameras, and other surveillance sources into open, playable formats. It supports automated batch conversion, drag-and-drop processing, customizable codecs and output formats, file splitting/merging, playback-speed correction, and watch-folder automation. The original evidence is preserved, while the software creates a playable proxy and a conversion report, helping investigators and prosecutors review surveillance footage without relying on proprietary players.

## AMPED ENGINE

Amped Engine is a command-line CCTV/DVR video conversion engine designed to integrate directly into third-party systems such as digital evidence management platforms, video analytics solutions, and evidence storage infrastructure. It converts proprietary and otherwise unplayable video formats from CCTV/DVRs, body-worn cameras, dashcams, mobile devices, drones, and other sources while preserving original video quality and relevant metadata where possible. It supports batch conversion, configurable conversion settings, automated processing, detailed conversion logs, and forensic preservation of the original files, making it particularly useful for organizations handling large volumes of surveillance evidence.

## SMART TRACKER FRS

Smart Tracker FRS by Speech Pro Technologies is an AI-powered facial recognition, biometric identification, and video analytics platform designed for real-time public security. It can track subjects across multiple CCTV streams, build geolocated movement routes, perform face searches on live or uploaded video/images, and generate customizable real-time alerts and automated reports. The platform supports large-scale deployments with 10,000+ CCTV cameras and databases containing millions of face records, with retrospective search, filtering, multi-user web access, REST API integration, and flexible CPU/GPU processing.

## FORTIFY

Corsight Fortify is an advanced AI-powered facial recognition and visual intelligence platform designed for real-time and forensic investigations. It can identify persons of interest across existing camera infrastructure, including crowded scenes, low-light environments, extreme viewing angles, motion-blurred footage, and partially covered faces. Fortify supports parallel processing of hundreds of cameras, large watchlists, real-time alerts, forensic video analysis, edge/offline processing, and integration with existing security and access-control systems. Built-in privacy tools can also blur faces of non-relevant individuals.

## AMPED FIVE

Amped FIVE is a comprehensive forensic image and video enhancement and analysis software designed for law enforcement, forensic laboratories, government, military, and investigative teams. It supports CCTV/DVR, body-camera, and other image/video formats, with more than 140 filters and tools for video conversion, restoration, enhancement, deblurring, stabilization, super-resolution, perspective correction, object tracking, measurement, and metadata/codec analysis. Investigators can also annotate and redact footage, combine multiple sources, export processed evidence, and automatically generate detailed scientific reports documenting the processing steps, settings, and algorithms for repeatable and court-defensible analysis.

## AMPED REPLAY

Amped Replay is an easy-to-use forensic video player and first-level analysis tool for police investigators and frontline teams. It can play and convert proprietary footage from CCTV/DVRs, body cameras, dashcams, drones, mobile phones, and other sources, while providing quick video correction, motion detection, annotation, bookmarking, redaction, and evidence export. Its non-destructive workflow preserves the original evidence and generates detailed reports documenting processing, annotations, and redactions. Replay can also export projects directly to Amped FIVE for deeper forensic video analysis.

## MOBILEdit CAMERA BALLISTICS

MOBILedit Camera Ballistics is a specialized digital image source-identification and forensic verification tool that determines whether a photograph was captured by a specific camera. Instead of relying only on EXIF metadata, it analyzes the camera sensor's unique PRNU/pattern-noise fingerprint and compares it with the image under investigation. Investigators can create a sensor fingerprint from reference photographs, analyze questioned images, and generate detailed PDF forensic reports containing match probability, correlation, camera details, GPS data, and other analysis results. It can also be combined with MOBILedit Forensic to distinguish photos actually captured by a phone from downloaded, shared, or received images.

## AMPED AUTHENTICATE

Amped Authenticate is a specialized forensic image, video, and deepfake authentication solution used to verify the integrity, authenticity, source, and processing history of digital media. It provides 40+ forensic tools and filters for metadata and file-structure analysis, tampering localization, compression analysis, camera/source identification using PRNU, and AI-assisted deepfake detection. Its dedicated video mode also supports frame/GOP analysis, macroblock and motion-vector analysis, double-compression detection, continuity analysis, and video source identification. Investigators can compare evidence with reference media and generate customizable, scientifically supported forensic reports documenting the analysis and results.

## PI-AUTHENTIFY

pi-authentify by Pi Lab is an AI-powered deepfake detection and media authentication platform designed to identify manipulated videos, images, and audio. It uses forensic-grade AI to provide frame- and segment-level authenticity analysis, explainable detection results, real-time verification, and tampering localization. The platform supports API/SDK integration, multilingual and multi-format analysis, on-premises or cloud deployment, and court-ready forensic reports, making it suitable for law enforcement, forensic laboratories, defence, BFSI, and enterprise investigations.

## REALITY DEFENDER

Reality Defender is an AI-powered deepfake detection and media authentication platform designed to protect government agencies from synthetic-media threats. It analyzes audio, video, and images to detect AI-generated content, voice impersonation, manipulated video, and synthetic identities, providing real-time risk scoring, alerts, and detailed reporting. The platform can integrate with existing security infrastructure through encrypted APIs and supports on-device deployments, making it suitable for government communications, call-center fraud prevention, secure video-conferencing, identity and access management, and executive impersonation detection.

## EQUINOX MEDIA MONITORING SOLUTION

Equinox is a comprehensive TV, Radio, OTT, and digital media monitoring and recording platform designed for broadcasters, media organizations, and monitoring agencies. It provides 24/7 compliance recording, media archiving, content search, audio/video detection, logo detection, thumbnail-based navigation, ratings analysis, and multi-channel monitoring. Equinox can also monitor OTT and IP streams, support centralized remote configuration, and scale into a logger farm for higher recording capacity. Its Multiviewer module adds real-time monitoring, alerts, SCTE, bandwidth, audio-loudness, and QoE/QoS monitoring capabilities.

## SOCIAL NETWORK HARVESTER

Social Network harvester by Maltego Evidence is a specialized social media investigation and evidence preservation platform that helps investigators collect, preserve, analyze, and visualize publicly available social-media data from multiple platforms. It provides a unified interface for large-scale data collection, account linking, social-network analysis, pattern discovery, target profiling, evidence preservation, and detailed reporting. Investigators can store evidence locally, maintain a clear chain of original evidence, collaborate with other teams, and export reports. The platform is designed to collect publicly available data without bypassing security measures or accessing private content.

## CYABRA

Cyabra is an AI-powered narrative intelligence and social media threat analysis platform that helps governments and enterprises distinguish authentic online activity from coordinated manipulation. It analyzes actors, behaviors, content, sentiment, narratives, images, and videos to detect bots and fake profiles, coordinated inauthentic campaigns, misinformation, AI-generated content, deepfakes, and impersonation. Key capabilities include real-time narrative alerts, visual and link analysis, deepfake detection, sentiment analysis, media analysis, and evidence-based reporting, with deployment available through SaaS, on-premises environments, managed services, and APIs.

# Cloud Forensics Tools

## Contact Us

hello@forfrasolutions.com |

[www.forfrasolutions.com](http://www.forfrasolutions.com)

## MOBILELIT CLOUD FORENSIC

MOBILEdit Cloud Forensic is a cloud evidence acquisition and forensic reporting solution that helps investigators collect data from cloud storage, social networks, messaging platforms, email, and other online services. Supports token-based, username/password authentication, concurrent extraction from multiple cloud accounts, full file-structure downloads, filtering, and customizable forensic reports in PDF, HTML, XML, UFDR, and Excel formats. It can work directly with MOBILEdit Forensic PRO by using credentials or tokens recovered from mobile devices, or operate as a standalone solution for authorized cloud investigations. Supported services include Google Drive, Dropbox, OneDrive, Box, Facebook, Instagram, LinkedIn, Slack, Microsoft Teams, Skype, Gmail, Outlook, and others

## MAGNET AXIOM CLOUD

Magnet AXIOM Cloud is a cloud forensics solution that helps investigators collect and analyze evidence from cloud services and online accounts. It enables investigators to bring cloud-based evidence into a forensic case, correlate it with mobile and computer evidence, and use AXIOM's search, filtering, artifact analysis, timeline, and visualization capabilities to identify relevant information. This allows investigators to build a more complete picture by connecting cloud activity with data from devices and other digital sources within a single investigation workflow.

## OXYGEN CLOUD EXTRACTOR

Oxygen Forensics Cloud Extractor is a comprehensive cloud forensics solution that enables investigators to collect evidence from a wide range of cloud services, including messaging platforms, social media, iCloud, Google services, travel platforms, device accounts, drones, IoT devices, and fitness applications. It supports rapid extraction, credential and token collection, encrypted WhatsApp backup decryption, and QR-based acquisition for supported services. Collected cloud data can then be analyzed using timelines, social-link analysis, location information, image and facial categorization, helping investigators correlate cloud evidence and uncover connections across multiple sources.

## XRY CLOUD

XRY Cloud is a cloud forensics solution that enables authorized investigators to recover digital evidence stored beyond the physical mobile device, including data from services such as Facebook, Google, iCloud, Twitter, Snapchat, WhatsApp, and Instagram. It can use app tokens recovered during XRY mobile extraction to access supported cloud data, and it also supports external cloud recovery when the physical device is not available. Recovered cloud evidence can be combined into an XRY Case File, keeping mobile and cloud evidence together for investigation and analysis.

## CELLEBRITE CLOUD ANALYZER

Cellebrite Physical Analyzer is a comprehensive digital forensic analysis platform for examining evidence extracted from mobile devices, applications, and cloud sources. It enables investigators to decode and analyze application data, recover deleted content, build timelines, visualize relationships, and correlate evidence from multiple sources. For cloud forensics, Physical Analyzer can analyze cloud-derived evidence and backups, including data from supported cloud services and applications, allowing investigators to combine cloud artifacts with mobile extractions for a broader investigative picture. It also provides advanced search, filtering, visualization, artifact correlation, and reporting capabilities to help identify communications, locations, accounts, activities, and connections across the collected evidence.

## MD-CLOUD

MD-CLOUD by GMD-Soft is a dedicated cloud forensic extraction and analysis software designed to collect and examine evidence from cloud accounts and online services. It supports services including Google, iCloud, Samsung Cloud, Naver Cloud, OneDrive, Baidu, Evernote, Twitter, and IMAP/POP3, along with cloud data from supported IoT devices. The solution supports multiple authentication methods such as ID/password, CAPTCHA, two-step verification, and credential-based authentication, as well as web capture when API-based acquisition is unavailable. Investigators can monitor acquisitions in real time, preview and filter cloud evidence, verify integrity using MD5/SHA-256 hashing, and generate PDF and Excel reports. MD-CLOUD can also work with MD-RED to acquire cloud data using credentials identified during forensic analysis.

## ELCOMSOFT CLOUD EXPLORER

Elcomsoft Cloud eXplorer (ECX) is a cloud forensics solution designed to help investigators collect, access, and analyze evidence stored in cloud accounts. It can acquire supported data from services such as Google Accounts, Microsoft accounts, and Apple iCloud, including emails, contacts, calendars, photos, documents, and other user information. ECX helps forensic teams conduct remote cloud investigations efficiently while organizing acquired data for detailed examination and reporting, making it valuable for law enforcement, corporate investigations, and digital forensic laboratories.

# OSINT/Web Intelligence Tools

## Contact Us

+91 97110 15337 | +91 89823 07608

hello@forfrasolutions.com |

www.forfrasolutions.com

## SOCIALNET

SocialNet by Shadow-Dragon is an OSINT-based social media investigation and analysis tool that helps investigators identify aliases, uncover relationships, and map networks across publicly available social-media data. It provides identity resolution, cross-platform correlation, digital breadcrumbs, network visualization, geographic insights, and near-real-time analysis, helping investigators trace connections, behavioral patterns, and online activity. It is suited for law enforcement, government, corporate security, fraud investigations, and cyber threat intelligence, particularly for criminal investigations, threat assessments, human trafficking, and cyber-enabled crime.

## HORIZON MONITOR

Horizon Monitor by Shadow-Dragon is a continuous OSINT monitoring and intelligence platform that helps investigators track people, keywords, topics, and investigative themes across publicly available online sources. It automates recurring searches, detects new mentions, emerging risks, behavioral changes, and potential threats, and provides configurable alerts based on investigative relevance. It is designed for law enforcement, government, corporate security, fraud and risk, and cyber threat intelligence teams, helping them move from one-time searches to continuous intelligence monitoring.

## HORIZON IDENTITY

Horizon Identity by Shadow-Dragon is an OSINT-based digital identity investigation and rapid-triage platform that helps investigators assess and validate people, aliases, and online identities using a single starting point such as a username, email address, phone number, or alias. It searches 600+ publicly available sources, correlates digital identities across platforms, and helps investigators quickly validate genuine connections, eliminate false leads, and uncover relevant digital footprints. It is designed for law enforcement, government, corporate security, fraud and risk, finance, and cyber threat intelligence investigations.

## REVERSE PHONE NUMBER LOOKUP

ESPY Reverse Phone Number Lookup is an OSINT and phone intelligence solution that enriches a phone number with publicly available identity and risk information. It can identify line type and carrier, country and regional location, active status, reputation and spam indicators, linked social profiles, usernames, and other digital footprints across global sources. Supporting 195+ countries, the platform provides structured results through a REST API/JSON, making it suitable for identity verification, fraud detection, background research, and investigative intelligence workflows.

## OSINT INVESTIGATION CENTER

ESPY OSINT Investigation Center is a centralized AI-powered WEBINT/OSINT investigation platform that supports the complete intelligence workflow—from data collection and automated profiling to analysis, monitoring, and reporting. Investigators can start with a phone number, email, name, social ID, group, hashtag, or other data point, then automatically gather information from open sources, social media, and surface, deep, and dark web sources. It provides identity profiling, social-network/link analysis, sentiment and timeline analysis, online community monitoring, dark-web monitoring, target identification, and automated alerts, helping law enforcement, national security, corporate intelligence, and financial investigation teams build comprehensive intelligence profiles.

## PORT SECURITY CENTER

Port Security Center by ESPY is a centralized maritime OSINT and intelligence platform designed to monitor and investigate vessels, containers, and personnel. Investigators can enter a ship name or MMSI/IMO number to automatically gather intelligence from multiple open sources, generate vessel profiles, review ownership and traffic history, and monitor container locations and ownership. It also supports crew and personnel profiling, social-link analysis, anomaly detection, ongoing monitoring, and automated alerts, helping port authorities, law enforcement, and national-security teams identify potential maritime threats and suspicious activity.

## GEO PROFILER

Geo Profiler by ESPY is a location-based OSINT intelligence platform that identifies and profiles publicly available social-media information associated with people within a specified geographic area. Investigators can define a target location or polygon and apply parameters such as age and gender, while the platform performs continuous geo-monitoring, AI-based face recognition, social-link analysis, profiling, and smart alerting. Collected intelligence can be imported or exported to other investigation systems, making it useful for law enforcement, national security, public safety, corporate intelligence, and sensitive-location monitoring.

## MASS PROFILER

Mass Profiler is a large-scale OSINT and population profiling platform designed to generate intelligence profiles of people within a defined geographic area. It uses publicly available online and social-media data to identify and analyze large populations, social profiles, demographic characteristics, digital identities, relationships, and behavioral patterns at scale. The platform helps investigators and intelligence teams discover trends, connections, groups, and potential risks across a target area, supporting applications in law enforcement, national security, public safety, corporate intelligence, and financial investigations. ESPY positions Mass Profiler as a complementary solution to its Geo Profiler, extending location-based intelligence from individual target profiling to population-level analysis.

## EMAIL LOOKUP

Email Lookup by ESPY is an email intelligence and identity verification solution that turns an email address into a broader digital profile. It can verify mailbox and domain status, provider information, geographic signals, reputation and risk indicators, breach history, associated names and usernames, and linked social/professional profiles across 200+ platforms. It also helps identify disposable or suspicious email accounts and assess the age and depth of an email's digital footprint. The platform provides real-time API-based results, making it useful for OSINT investigations, fraud detection, KYC/compliance, cybersecurity, and identity verification.

## FACIAL RECOGNITION SEARCH

Facial Recognition Search by ESPY is an AI-powered facial search and identity intelligence solution that compares an uploaded face against publicly available images across social networks, news sources, professional directories, and other open-web sources. It provides facial similarity scores, matching profile URLs, names and platform information, identity/alias discovery, historical digital-footprint validation, and relationship mapping. The IRBIS AI engine supports API-based searches and can return structured JSON results with confidence scores and source metadata, making it useful for OSINT, identity verification, fraud investigation, and investigative research.

## PUBLIC OPINION CENTER

Public Opinion Center is a WEBINT-based public opinion monitoring and analysis platform that continuously collects and analyzes online conversations around specific topics, events, brands, hashtags, social groups, and profiles. It uses AI to assess sentiment, community opinions, social hierarchies, key influencers, and emerging trends, while supporting continuous monitoring and real-time alerts based on keywords, faces, and social connections. The platform is designed for corporate intelligence, law enforcement, national security, public safety, maritime intelligence, and financial institutions to understand public sentiment and identify emerging threats or opportunities.

## NAME LOOKUP

ESPY Name Lookup is an OSINT-based identity intelligence solution that starts with a person's name and builds a broader digital identity profile from publicly available sources. It searches 200+ platforms to discover social accounts, usernames, web presence, and associated identity signals, while providing profile URLs, confidence scores, linked emails/phone numbers, web-presence depth, and cross-platform consistency analysis. Investigators can optionally add location or affiliation information to improve accuracy, making it useful for OSINT investigations, KYC, background screening, AML, fraud detection, and identity verification.

## GARGOYLE INVESTIGATOR™ MP

Gargoyle Investigator™ MP by WetStone Labs is an advanced malware discovery and forensic triage solution designed for digital forensic laboratories, law enforcement, and incident response teams. It rapidly identifies malicious and suspicious applications—including ransomware, Trojans, keyloggers, spyware, rootkits, hacking tools, and anti-forensic software—helping investigators understand potential criminal activity, intent, and capabilities. It also supports hash-based scanning and comprehensive forensic reporting, making it useful for analyzing seized devices, forensic images, and investigation evidence.

## GARGOYLE INVESTIGATOR™ MP

Gargoyle Enterprise Manager™ (GEM) by WetStone Labs is an enterprise security and threat-detection solution focused on identifying insider threats, unauthorized applications, malicious software, and potentially unwanted programs across network endpoints. It provides proactive endpoint scanning, hash-based threat detection, customizable search criteria, whitelisting, and YARA rule support, along with regularly updated threat-intelligence datasets and detailed reporting. GEM helps organizations detect suspicious tools, unauthorized encryption or steganography software, and potential data-exfiltration activity before they cause significant damage.

## EXTERRO FTK CENTRAL

Exterro FTK Central is a centralized, enterprise-grade digital forensics platform designed to manage live endpoint investigations, remote evidence collection, processing, analysis, review, collaboration, and case management from a unified environment. It enables forensic teams to investigate distributed endpoints, process large volumes of evidence, collaborate across investigators, and maintain controlled, auditable workflows. FTK Central also integrates with cloud/SaaS sources and enterprise security platforms, making it suitable for corporate investigations, incident response, law enforcement, and large-scale forensic laboratories.

## EXTERRO FTK ENTERPRISE

Exterro FTK Enterprise is an enterprise digital forensics and remote evidence collection solution that enables investigators to securely acquire and analyze forensic data from remote endpoints without physical access. It supports targeted, forensically sound collection from Windows, Mac, and Linux systems, including devices that are temporarily offline, while its persistent agent enables rapid response across large and distributed environments. FTK Enterprise helps organizations investigate data breaches, intellectual property theft, file tampering, insider threats, and other internal security incidents while reducing the need for device shipping and manual imaging.

**exterro®**

## JAMF NOW SMALL AND MEDIUM-SIZED ORGANIZATIONS

Jamf Now is a cloud-based Apple Mobile Device Management (MDM) solution designed mainly for small and medium-sized organizations to set up, manage, and secure Mac, iPhone, iPad, and other Apple devices from a central dashboard. It enables administrators to enroll devices, deploy applications, configure Wi-Fi and email, manage OS updates, maintain device inventory, enforce passcodes and encryption, deploy configuration profiles, and remotely lock or wipe lost devices. Its Blueprints feature allows administrators to bundle apps, settings, and restrictions and apply them consistently to selected devices.

## JAMF MOBILE FORENSICS

Jamf Mobile Forensics is an advanced mobile threat detection, DFIR, and forensic analysis solution for iOS and Android devices, designed primarily to protect high-risk users and organizations against mercenary spyware such as Pegasus and Predator, zero-click exploits, APTs, and other sophisticated attacks. It automatically collects and analyzes system, kernel, application, crash, Wi-Fi, and security telemetry without rooting or jailbreaking the device and without collecting personal content such as messages, photos, passwords, contacts, or call data. It uses behavioral analytics, Indicators of Compromise (IoCs), automated rules, incident timelines, and AI-assisted analysis to identify suspicious activity and help security teams investigate and respond quickly. It supports remote DFIR, proactive threat hunting, SOC workflows, MDM deployment, and SIEM/SOAR integrations, making it particularly suitable for government, enterprise, and other high-security environments.

## JAMF PRO

Jamf Pro is an enterprise-grade Apple device management (MDM) platform used by organizations to centrally manage and secure Mac, iPhone, iPad, Apple TV, Apple Watch, and Apple Vision Pro devices. It enables IT teams to enroll devices, configure security settings, deploy and update applications, manage operating-system updates, maintain hardware/software inventory, enforce compliance policies, and remotely issue management commands. Its zero-touch deployment allows devices to be automatically configured when issued to users, while Smart Groups and policies help automate management for large device fleets. Devices are enrolled into Jamf Pro, typically through Apple Business Manager/Automated Device Enrollment or user-initiated enrollment. Once enrolled, administrators manage them remotely through the Jamf Pro web console, applying configurations, apps, restrictions, updates, and security policies.

## JAMF PROTECT

Jamf Protect is an Apple-focused endpoint security and mobile threat defense solution used by enterprises, government organizations, and other teams to protect Mac, iPhone, iPad, and other supported devices against malware, phishing, risky applications, network threats, and security vulnerabilities. It runs security components on the endpoint and uses Apple's native security frameworks to monitor processes, files, downloads, USB activity, and other security events in real time. It analyzes this activity using threat intelligence and behavioral detection, then can block malicious processes, quarantine files, block unsafe websites, detect risky apps or jailbreaks, and generate alerts. Security telemetry can also be forwarded to SIEM platforms such as Splunk or Microsoft Sentinel for investigation.

## JAMF MOBILE FORENSICS

Jamf Mobile Forensics is an advanced mobile threat detection, DFIR, and forensic analysis solution for iOS and Android devices, designed primarily to protect high-risk users and organizations against mercenary spyware such as Pegasus and Predator, zero-click exploits, APTs, and other sophisticated attacks. It automatically collects and analyzes system, kernel, application, crash, Wi-Fi, and security telemetry without rooting or jailbreaking the device and without collecting personal content such as messages, photos, passwords, contacts, or call data. It uses behavioral analytics, Indicators of Compromise (IoCs), automated rules, incident timelines, and AI-assisted analysis to identify suspicious activity and help security teams investigate and respond quickly. It supports remote DFIR, proactive threat hunting, SOC workflows, MDM deployment, and SIEM/SOAR integrations, making it particularly suitable for government, enterprise, and other high-security environments.

## JAMF PRO - ENTERPRISE

Jamf Pro is an enterprise-grade Apple device management (MDM) platform used by organizations to centrally manage and secure Mac, iPhone, iPad, Apple TV, Apple Watch, and Apple Vision Pro devices. It enables IT teams to enroll devices, configure security settings, deploy and update applications, manage operating-system updates, maintain hardware/software inventory, enforce compliance policies, and remotely issue management commands. Its zero-touch deployment allows devices to be automatically configured when issued to users, while Smart Groups and policies help automate management for large device fleets. Devices are enrolled into Jamf Pro, typically through Apple Business Manager/Automated Device Enrollment or user-initiated enrollment. Once enrolled, administrators manage them remotely through the Jamf Pro web console, applying configurations, apps, restrictions, updates, and security policies.

## MOBILEDIT FORENSIC ULTRA

MOBILedit Forensic ULTRA is an advanced mobile forensic solution designed for law enforcement, military, and forensic professionals to access and examine protected data from smartphones, smartwatches, and cloud sources. It offers security bypassing, password detection, brute-force and chipset-based techniques, GPU acceleration, FDE/FBE decryption, exploit support, and compatibility with the latest Android devices, enabling deeper forensic access during authorized investigations.

## PC-3000 MOBILE PRO

PC-3000 Mobile PRO is a specialized hardware-software mobile forensic recovery solution designed for law-enforcement use, particularly for challenging locked, damaged, or inaccessible Android smartphones and tablets. It uses low-level access techniques to recover evidence when conventional extraction methods are insufficient, including chipset-level access, Chip-off methods, standard interfaces, and previously created image files. It can provide access to devices protected by modern encryption and from devices that may not boot normally, depending on the device and case. The recovered data can then be exported for further forensic analysis with third-party tools.

## PASSWARE KIT MOBILE

Passware Kit Mobile is a mobile forensic password-recovery solution designed to help investigators decrypt and access protected mobile device backups and encrypted evidence. It supports recovery of passwords and encryption keys from various mobile platforms and backup formats, enabling forensic professionals to access otherwise inaccessible data for investigation and analysis. It is particularly useful for law enforcement, digital forensic laboratories, and incident response teams handling password-protected mobile evidence.

## ELCOMSOFT MOBILE FORENSIC BUNDLE

Elcomsoft Mobile Forensic Bundle (EMFB) is a comprehensive mobile forensic toolkit that enables investigators to perform physical, logical, and over-the-air acquisition of smartphones and tablets. It supports forensic extraction and analysis of iOS devices, iCloud and Google account data, recovery of mobile backup passwords, and decryption of encrypted backups using GPU acceleration. The bundle combines tools such as Elcomsoft iOS Forensic Toolkit, Phone Breaker, Phone Viewer, and Cloud eXplorer, making it suitable for law enforcement, government agencies, corporate investigations, and digital forensic laboratories.

## ELCOMSOFT IOS FORENSIC TOOLKIT

Elcomsoft iOS Forensic Toolkit (EIFT) is an advanced forensic acquisition solution designed to extract and analyze data from iPhone, iPad, and other iOS devices. The toolkit supports full file system extraction, logical acquisition, keychain extraction, password recovery, and decryption of protected data, enabling investigators to access evidence that may not be available through standard forensic methods. It also provides access to system logs, application data, browser history, messages, and other critical artifacts, making it a powerful tool for law enforcement, digital forensic laboratories, and incident response teams conducting iOS investigations.

## ELCOMSOFT PHONE BREAKER

Elcomsoft Phone Breaker (EPB) is a digital forensic solution designed to help investigators acquire and decrypt data from cloud services and mobile device backups. It supports forensic access to Apple iCloud data, iOS backups, Microsoft accounts, and other supported cloud-stored evidence, including contacts, messages, photos, documents, and application data. EPB is particularly useful for law enforcement, corporate investigations, and forensic laboratories where investigators need to recover evidence from cloud accounts and protected backups.

## ELCOMSOFT PREMIUM

Elcomsoft Premium Forensic Bundle (EPFB) is an all-in-one digital forensic suite that combines ElcomSoft's desktop, mobile, password recovery, decryption, and evidence analysis tools in a single package. It supports logical, physical, and over-the-air mobile acquisition, cloud data extraction from Apple, Microsoft, and Google services, and recovery of deleted evidence. The bundle also provides password recovery and decryption capabilities for Microsoft Office, PDF, ZIP/RAR, BitLocker, PGP, VeraCrypt, TrueCrypt, macOS Keychain, Windows/macOS passwords, and numerous other formats, making it a comprehensive solution for law enforcement, government agencies, corporate investigators, and forensic laboratories.

## ELCOMSOFT DESKTOP

Elcomsoft Desktop Forensic Bundle (EDFB) is an all-in-one password recovery and decryption suite designed for digital forensic investigators, government agencies, and corporate security teams. It combines ElcomSoft's leading desktop password-recovery tools to unlock documents, decrypt archives, and access encrypted containers across hundreds of formats, including Microsoft Office, PDF, ZIP/RAR, BitLocker, PGP, TrueCrypt, VeraCrypt, Windows/macOS passwords, and macOS Keychain. With GPU acceleration, distributed password recovery across up to 10,000 computers, remote management, and detailed job tracking, EDFB enables fast and scalable recovery of protected digital evidence.

## ELCOMSOFT DISTRIBUTED PASSWORD RECOVERY

Elcomsoft Distributed Password Recovery (EDPR) is high-performance password recovery solution designed for forensic, government, corporate, and data recovery environments. It can recover passwords and encryption keys across 300+ data formats, including Microsoft Office, PDF, ZIP/RAR, BitLocker, PGP, TrueCrypt, VeraCrypt, FileVault 2, and LUKS. EDPR uses GPU-accelerated processing with NVIDIA and AMD hardware, supports heterogeneous GPUs, and provides distributed recovery across up to 10,000 networked computers with linear scalability. It also offers centralized job management, remote deployment, and resource monitoring, making it suitable for large-scale forensic and password recovery operations.

## FORENSIC DISK DECRYPTOR

Elcomsoft Forensic Disk Decryptor (EFDD) is a specialized digital forensic solution designed to access and decrypt encrypted disks, volumes, and containers protected by BitLocker, FileVault 2, PGP Disk, TrueCrypt, VeraCrypt, LUKS/LUKS2, and BestCrypt. It can extract encryption keys from RAM captures, hibernation files, and page files, as well as use recovery or escrow keys where available. Investigators can either fully decrypt encrypted evidence or mount protected volumes for real-time access. When keys are unavailable, EFDD can extract encryption metadata for GPU-accelerated password recovery using Elcomsoft Distributed Password Recovery, making it valuable for law enforcement, government agencies, and digital forensic laboratories.

## PASSWARE KIT ULTIMATE

Passware Kit Ultimate is all-in-one forensic decryption and password-recovery solution designed for law enforcement, government agencies, forensic laboratories, and corporate investigation teams. It combines mobile forensics, password recovery, full-disk decryption, device decryption, and live-memory analysis in a single platform. The solution supports 420+ file types and 1,150+ mobile devices, with capabilities for recovering passwords, decrypting BitLocker, FileVault, VeraCrypt, TrueCrypt, APFS, LUKS and other encrypted volumes, as well as extracting encryption keys from live memory. GPU acceleration and distributed computing further enable high-speed password recovery across multiple computers.

## PASSWARE KIT FORENSIC

Passware Kit Forensic is comprehensive encrypted-evidence discovery and decryption solution designed for digital forensic investigators, law enforcement, government agencies, and corporate investigations. It automatically identifies password-protected files and encrypted disk images, supporting 420+ file types and full-disk encryption formats such as BitLocker, FileVault2, APFS, LUKS/LUKS2, PGP, TrueCrypt, and VeraCrypt. It also provides live memory analysis, GPU-accelerated password recovery, batch processing, and distributed recovery through Passware Kit Agents, making it suitable for large-scale forensic investigations and encrypted evidence examination.

## ELCOMSOFT QUICK TRIAGE

Elcomsoft Quick Triage (EQT) is a rapid digital forensic triage solution designed to collect, process, and analyze critical evidence from Windows computers during the early stages of an investigation. It extracts system information, user activity, browser history, communications, documents, credentials, USB activity, Windows Event Logs, Prefetch, Shimcache, SRUM, and other important forensic artefacts. EQT provides on-the-fly indexing, global search, timeline analysis, memory acquisition, Windows password recovery, and an open VHDX evidence container, allowing investigators to quickly identify relevant evidence in both field and laboratory investigations.

## ADF TRIAGE-INVESTIGATOR

ADF Triage-Investigator is a field-deployable digital forensic triage solution designed to provide fast, forensically sound access to court-defensible evidence from computers and digital storage. It can investigate live and powered-off systems, forensic images, folders, network shares, and multiple file systems, while offering RAM capture, powerful boot capabilities, automated imaging, hash and keyword matching, timeline analysis, video preview, deleted-image recovery, and BitLocker/FileVault2 support. Its intuitive interface and automated prosecution-ready reporting help investigators rapidly collect and analyze evidence, reduce forensic backlogs, and collaborate effectively with forensic laboratories.

## ADF MOBILE DEVICE INVESTIGATOR

ADF Mobile Device Investigator® (MDI) is a rapid mobile forensic triage and acquisition solution designed for front-line law enforcement, analysts, and forensic examiners. It enables fast collection and preview of evidence from iOS and Android devices, supports multiple-device scanning, real-time keyword searching, artifact profiling, image-based classification, relationship analysis, and advanced logical acquisition. MDI also provides screen/video capture with OCR, hash and PhotoDNA searching, evidence tagging, and exportable HTML, CSV, and PDF reports, helping investigators quickly identify and document relevant mobile evidence in the field.

## MD-LIVE

MD-LIVE is designed for rapid on-site mobile forensic triage and selective evidence collection, allowing investigators to quickly scan devices, collect targeted data, analyze relevant apps and communications, and document investigative actions in real time. It helps investigators quickly identify and collect relevant evidence in the field, while MD-RED helps forensic analysts conduct detailed examination and correlation of the collected evidence in the laboratory.

## DETEGO FIELD TRIAGE

Detego Field Triage is a portable digital forensic triage solution designed to rapidly identify investigation-relevant data from computers, laptops, servers, and removable media without requiring lengthy forensic extraction and analysis. It uses keyword searching, hash matching, automation, and a patented red-amber-green alert system to help investigators quickly assess evidence in time-critical situations. With Xpress HashScan, CAID and Project VIC integration, customizable investigation profiles, and a user-friendly interface, Field Triage is suitable for law enforcement, military, corporate investigations, and specialized investigations such as fraud, human trafficking, terrorism, and CSAM/IIOC cases.

## BELKASOFT TRIAGE

Belkasoft T is a portable digital forensic triage solution designed for first responders and investigators who need to quickly identify and collect critical evidence from Windows systems at an incident scene. It can detect 1,500+ computer, mobile, and cloud artefacts, including emails, chats, browser data, system settings, mobile backups, virtual machines, and memory files. The solution supports RAM acquisition, hash-based detection, skin-tone image detection, selective evidence acquisition, real-time analysis, and partial or complete result export, allowing investigators to rapidly obtain leads and create evidence images for deeper examination in Belkasoft X.

## CYBER TRIAGE

Cyber Triage is an automated DFIR and cyber incident investigation platform designed for SOCs, MSSPs, incident response teams, and law enforcement. It combines EDR telemetry and forensic artifacts, automatically scores and prioritizes suspicious evidence, and analyzes large datasets to help investigators identify relevant activity quickly. Key capabilities include automated evidence collection, artifact prioritization, attack-scenario analysis, EDR/SOAR integration, collaborative investigations, and AI-assisted investigations, with deployment options for laptops, cloud, or on-premises environments.

## MAGNET OUTRIDER

Magnet Outrider is a rapid digital forensic triage solution designed to quickly examine Windows and Mac computers, iOS and Android devices, and external drives in the field or laboratory. It can identify actionable evidence such as messages, contacts, browser history, user activity, illicit applications, usernames, and CSAM without requiring a full forensic extraction. Key capabilities include multi-device scanning, keyword and URL searches, MD5/MAG24 hash matching, automated CSAM detection, live system artifact collection, RAM capture, screenshots, and encryption-key discovery, enabling investigators to obtain critical leads within minutes.

## AED4000 - EMOTION DETECTION

Anubhooti AED4000 is an automatic speech emotion detection system designed to identify anger, aggression, happiness, sadness, fear, surprise, and stress from audio segments at five-second intervals. It supports both mono and stereo audio, with capabilities for speaker diarization, noise reduction, stereo-channel separation, automatic mood profiling, and detailed emotion reporting in CSV format. The system also provides essential audio-processing functions such as recording, playback, splitting, normalization, and visualization, and can operate as a completely offline solution, making it suitable for forensic audio analysis, call-center investigations, and investigative applications.

## ASD4000 - SPEAKER DIARIZATION

Anubhooti ASD4000 is an automatic speaker diarization solution designed to separate and identify different speakers within disputed or multi-speaker audio recordings. It can automatically determine the number of speakers using an unsupervised mode and supports dedicated 2-, 3-, and 4-speaker diarization, with manual diarization available for recordings containing more than four speakers. The system also provides Signal-to-Noise Ratio (SNR) measurement, gender detection, stereo-channel separation, and essential audio-processing tools, and operates offline across mono and stereo audio formats, making it useful for forensic voice analysis and law-enforcement investigations.

## ASL5000 - SPEAKER IDENTIFICATION

Anubhooti ASL5000 is a forensic speaker identification and verification system designed to analyze, compare, and verify speakers based on their voice characteristics. It combines formant-based automatic speaker verification with manual comparison tools and can match suspect and control word pairs while generating detailed analysis reports. The system includes a comprehensive speech laboratory, word segregation, two-speaker diarization, noise cancellation, SNR/HNR measurement, cepstral and spectrum analysis, waveform-based IPA annotation, and advanced audio filtering. Its offline operation and support for different languages and accents make it suitable for forensic voice examination, law enforcement, and investigative audio analysis.

## AAA5000 - AUDIO AUTHENTICATION

Anubhooti AAA5000 is an audio authentication solution designed to detect deepfake/synthesized voices and audio tampering or modification. It analyzes spectrograms and multiple audio characteristics, including LPC discontinuities, copy-paste edits, sampling frequency, spectral changes, ENF variation, and background inconsistencies. The system automates these tests and generates a detailed report, while also providing basic audio-processing tools and offline operation for forensic investigations.

## CALL AUDIT & SPEECH ANALYTICS

Anubhooti Call Audit & Speech Analytics is a forensic speech-analysis solution that converts call recordings into punctuated text with speaker identification and timestamps. It distinguishes agent and client conversations, calculates the agent's speaking rate and tone, and uses emotion analysis to identify indicators such as aggressive speech based on vocal characteristics. These combined parameters can then be used for automated call auditing, quality assessment, and behavioral analysis.

## SPEECH-TO-TEXT SYSTEM

Anubhooti Speech-to-Text System is a speech analysis solution that converts audio recordings into searchable, punctuated text with speaker identification and timestamps. It supports speaker diarization to distinguish agent and client, calculates the agent's words-per-minute speaking rate and vocal tone, and uses emotion analysis to identify indicators such as aggressive speech. The system can process audio metadata and generate text outputs in Word format, making it suitable for call auditing, forensic audio analysis, investigations, and speech analytics.

## ANC3000 - NOISE CANCELLATION & SPEECH ENHANCEMENT SOLUTION

Anubhooti ANC3000 is an automatic noise-cancellation and speech-enhancement solution designed to clean noisy or disputed audio for further forensic analysis. It measures SNR, automatically tracks noise profiles, and uses multiband spectral subtraction to reduce background noise. The system also provides LPF, HPF, BPF, and BRF filters, pitch shifting, speech-to-text, speech analysis, word comparison, and speech enhancement, supporting both mono and stereo audio for forensic speech and audio investigations.

## ADAD5000 - DEEPPAKE AUDIO DETECTION

Anubhooti Deepfake Audio Detection System is a forensic solution designed to identify AI-generated, synthesized, or cloned voices by analyzing time- and frequency-based audio artifacts. It uses Metadata Analysis, Time Artifacts, Frequency Artifacts, zero and silence discontinuity, histogram analysis, and Copy-Paste detection to identify potential manipulation. The system also supports speaker verification using a control voice, automated testing with PDF/Word reporting, and essential audio-processing functions, with complete offline operation for forensic investigations.

## SPEECHPRO IKAR LAB 3

SpeechPro IKAR Lab 3 is a comprehensive forensic audio and media examination suite designed for forensic experts and law enforcement agencies. It combines advanced audio analysis, speaker comparison, speaker diarization, noise reduction, speech-to-text, audio spoofing and deepfake detection, along with video and facial forensics. The system supports transcription in 21 languages, speaker separation of up to 10 speakers, word-level alignment, detection of editing and tampering, and forensic-grade speaker comparison from recordings as short as 5 seconds.

## SPEECHPRO VOICEKEY

SpeechPro VoiceKey by speech Recognition Center is a biometric identity platform that uses AI-powered voice biometrics to remotely verify and authenticate individuals through their voice. It analyzes more than 70 voice biometric parameters and can perform text-independent, language-independent verification using only a few seconds of speech. VoiceKey also supports speaker verification, fraud and voice-fake detection, speaker diarization, and speech recognition, making it suitable for secure digital services, contact centers, government applications, and fraud prevention.

## PHONEXIA VOICE INSPECTOR

Phonexia Voice Inspector is a desktop forensic voice-analysis solution designed for police and forensic experts for speaker comparison, identification, and deepfake detection. It offers 98%+ speaker identification accuracy, 1:1, 1:N, and M:N voice comparison, language-, text-, and channel-independent analysis, and deepfake detection from as little as 3 seconds of speech. Additional features include user-managed population sets, Voice Activity Detection, automatic speaker diarization, phoneme recognition, spectrogram visualization, forensic-ready reporting, and secure 100% on-premises processing for reliable forensic investigations.

## PHONEXIA VOICE GUARDIAN

Phonexia Voice Guardian is a voice-biometric fraud prevention solution for contact centers that provides real-time and post-call protection against voice fraud and AI-generated deepfakes. It passively authenticates genuine customers from less than two seconds of speech, detects synthetic or cloned voices, and uses speaker clustering to identify fraudsters operating across multiple accounts or identities. It also provides real-time alerts for call-center agents, dedicated fraud-analysis tools, strong data privacy and encryption controls, and regional data hosting, helping organizations reduce voice-based fraud while maintaining customer convenience and control over sensitive voice data.

# PHONEXIA SPEECH PLATFORM

## Voice Biometrics

- Speaker Identification – Identifies individuals based on their voice.
- Forensic-grade speaker identification – Can identify a speaker from as little as 3 seconds of net speech.
- Text-independent identification – Identification does not depend on what words the person speaks.
- Language-independent speaker identification – Voice-based identification across different languages.
- Speaker Diarization – Automatically separates multiple speakers in audio.
- Gender Identification – Determines whether the speaker is male or female.
- Age Estimation – Estimates the speaker's age group.
- Emotion Recognition – Detects emotions expressed by speakers.
- Deepfake Detection – Detects synthetic, morphed, and cloned voices.

## Speech Recognition & Analysis

- Speech-to-Text (STT) – Converts speech into text with timestamps.
- 60+ transcription languages – Supports speech transcription across more than 60 languages.
- Language Identification – Detects the language or dialect spoken in audio.
- 140-language recognition – The platform can recognize languages across a broader set of 140 languages.
- Speech Translation – Converts spoken content into translated text.
- Keyword Spotting – Detects specified keywords or phrases without requiring complete transcription.
- Voice Activity Detection (VAD) – Identifies exactly where speech occurs in an audio recording.
- Audio Quality Estimation – Evaluates the acoustic and perceptual quality of audio.
- Time Analysis of Speech – Analyzes the flow, timing, and dynamics of conversations.
- Denoiser – Reduces background noise and improves speech audibility.

## Investigation & Intelligence

- Target Speaker Spotting – Searches large volumes of audio to locate a person of interest using only a few seconds of reference speech.
- Rapid Audio Filtering – Filters large audio collections based on silence, audio quality, language, speaker age, gender, and other properties.
- Intercepted Audio Analytics – Helps analyze large volumes of intercepted communications by combining voice biometrics and speech-recognition information.
- Multilingual Audio Intelligence – Combines transcription with speaker identity and demographic information to determine who said what.
- Automated Audio Classification – Classifies audio based on quality, languages, keywords, and voice biometric characteristics.

# Smart Watch Kit & Dive Forensic Kit.

## MOBILELIT SMARTWATCH FORENSIC

MOBILEdit Smartwatch Forensics enables investigators to extract and analyze valuable evidence from smartwatches, including health and heartbeat data, GPS/location history, messages, emails, notifications, and activity records. It supports major brands such as Apple Watch, Garmin, Samsung, and TCL, helping investigators reconstruct timelines and track movements even when a paired smartphone is unavailable or its data is deleted. Data can be acquired through full or selective extraction and presented in PDF, Excel, HTML, or UFDR formats, with backups available for future examination.

## MOBILELIT DIVE FORENSIC

MOBILEdit Dive Computer Forensics enables forensic investigators to extract and analyze data from dive computers, which can serve as a digital record of underwater activity. The solution can recover dive dates and times, depth, duration, water temperature, dive modes, decompression information, and physiological data such as heart rate. This evidence can help reconstruct underwater events, verify diving activities, assess compliance with dive protocols, and support investigations involving diving accidents, fatalities, disappearances, or disputed accounts.
